The impacts of industry restructuring

Just Transitions in the Australian automotive sector?

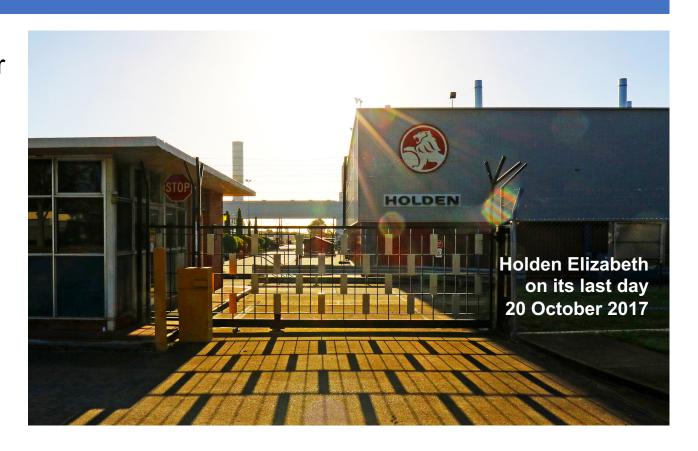

Introduction

The closure of the Australian passenger vehicle industry was foreshadowed in 2013 and 2014 through the announcement of the intention to close by Ford, General Motors and Toyota.

By 2017 the last plant had been shut down and an important phase in the nation's economic history ended.

Closure affected up to 100,000 employees working across manufacturers and the supply chain, with the impacts concentrated in Victoria and South Australia.

Our research

We examined both the processes and the outcomes of this transition.

We reviewed the measures put in place to assist workers displaced by plant closure, while also drawing on three waves of data from a longitudinal survey of retrenched workers.

We argue that the process of transition for former employees was shaped both by the distinctive characteristics of Australia's system of industrial relations and the ambition of governments to have as many of the affected find employment as possible.

We also note the complexity that emerged as a consequence of the COVID-19 pandemic.

Elements of Just Transition

Long-term planning Engaging with unions Engaging with communities Communication of plans Job guarantees and compensation Worker transition services Retraining workers Job quality Worker pensions The gender gap Role of education and research institutions Regional economies Diversifying economies Local infrastructure development Local government revenue streams Social cohesion Coal communities as social Identity Environmental remediation	Coordination	Just Transition principles and processes
Engaging with communities Communication of plans Job guarantees and compensation Worker transition services Retraining workers Job quality Worker pensions The gender gap Role of education and research institutions Regional economies Diversifying economies Local infrastructure development Local government revenue streams Social cohesion Engaging with communities Job quality Worker transition services Retraining workers Job quality Worker pensions The gender gap Role of education and research institutions Diversifying economies Local infrastructure development Local government revenue streams		Long-term planning
Redeploying workforces Job guarantees and compensation Worker transition services Retraining workers Job quality Worker pensions The gender gap Role of education and research institutions Regional economies Diversifying economies Local infrastructure development Local government revenue streams Social cohesion Coal communities as social Identity		Engaging with unions

Conclusion

Overall, the analysis suggests strong labour market outcomes for those who exited the labour force as a result of the departure of the OEMs.

However, not all dimensions of the analysis present a positive picture of resilience in the face of change.

Conclusion

Overall, there is much to celebrate in the labour market outcomes of workers made redundant from the Australian car industry. However, a simple focus on whether those made redundant appears insufficient, especially when judged against the benchmarks established for a Just Transition. There is a pressing need to address those broader dimensions of change towards a better future, including social cohesion, regional economies and co-ordination.

The Just Transition framework is now a mature and comprehensive perspective.

In many ways it represents an ideal for dealing with future plant closures and, if implemented, it would be a future that is more equal, productive and sustainable.
